The present invention describes a method (M1) of using a first anti-viral peptide (I) comprising a theta-defensin peptide in an amphipathic alphabelious structure in a lipid environment for reducing the infectivity of a virus. (I) can have virucide and anti-HIV activities, and can be used to reduce virus growth, infectivity burden, shed, and development of anti-viral resistance. (I) can be used for inhibiting the growth and proliferation of a virus and so can be used for; (a) protecting or treating subject form a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus in subject harbouring a latent virus, controlling virus shed from a VS. reducing percentage of VS in a contaminated within a virally-infected subject (VS), reducing virus latency in a VS, reducing virus shed from a VS. reducing percentage of VS in a contaminated tissue or fluid sample safe for use, or reducing the number of population regardless of virus; infection of viruses. (M1) is useful for infectious virus particles in a population of viruses, waire, cars, fowl and humans e.g. an enveloped virus infecting humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is administered to a patient who is immunosuppressed or to a subject who is cont infected with the virus, where the first anti-viral peptide is administered to a patient who is immunosuppressed to a patient who is immunosuppressed to a subject who is continity infected with the virus, where the first anti-viral peptide is administered by a cautely infected with the virus. The present sequence represents a rhesus monkey theta defensin anti-viral peptide, which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                 Anti-viral, viral infection; theta-defensin; lipid environment; amphipathic alpha-helical structure; virucide; anti-HIV; immunisation; viral growth inhibitor; viral proliferation inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New method of using a first anti-viral peptide comprising a Theta-
defensin peptide in an amphipathic Alpha-helical structure in a lipid
environment for reducing the infectivity of a virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Β;

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as AD03523-54003527. The theta of detailed in the claims or appearing as AD03523-4003527. The theta of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicidal inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the patient suffering from the antimicrobial activity and low haemolytic activity. The present sequence represents the rhesus monkey wild-type theta defensin RTD-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel theta defensin analog useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, contact lens solution, or eye wash solution, an inanimate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 1; SEQ ID NO 2; 46pp; English.

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO3527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbiscial inhibition of survival of microorganism as well as microbistatic inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for watering a patient suffering from the peptides are also useful for watering a patient suffering from the peptides are also useful for watering a patient suffering from the peptides are also useful for watering a patient suffering from the peptides are also useful for watering a patient suffering from the peptides are also useful for watering a patient suffering from the peptides are also we full for watering and the present sequence represents a Rhesus theta defensing have

The present invention describes a method (M1) of using a first anti-viral comprising a theta-defensin peptide in an amphipathic alphabetic peptide (I) comprising a theta-defensin peptide in an amphipathic alphabetic beliar structure in a lipid environment for reducing the infectivity of a virus. (I) can have virucles, and and can be used for inhibiting the growth and conce virus growth, infectivity burden, shed, and development of anti-confication of a virus and so can be used for; (a) protecting or treating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus in subject harbouring a latent virus, controlling virus is spread within a virally-infected subject (V8), reducing virus shed from a V3, reducing percentage of VS in a V8, reducing virus shed from a V3, reducing virus and infection status, or inducing latency in a V8, (b) reducing the infectivity of a virus; and (c) rendering virus.

CC population regardless of viral infection status, or inducing latency in a V8; (b) reducing the infectivity of a virus; and (c) rendering virus.

CC of infectious virus particles in a population of viruses. Wall is useful for reducing the infectivity of a virus in sheep, cattle, horses, swine, cats, fowl and humans e.g. an enveloped virus infecting humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is continitiested prior to or subsequent to the virus conteacting the subject who is definited by infected with the virus, where the first anti-viral peptide is most preferably administered to a subject who is contonically, latently or acutely infected with the virus acutely infected with the virus anti-viral peptide is most preferably administered to a subject who is contonically, latently or acutely infected with the virus acutely infected with the virus anti-viral peptide is most preferably administered to a subject who is sequence represents a chimeric human/ribected with the virus infected with the virus acutely infec

They can be used in the treatment of bacterial, viral, fungal, protozoan and helminthic infections, in disinfectants and as food preservatives
                                                                         Gaps
                                                                                                                                                                                                                                                        Theta defensin, antimicrobial, cyclic, bacterium, fungus, protozoan, virus, helminth; disinfectant, food preservative, analogue.
viral peptide, which is given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel theta defensin peptide with antimicrobial activity against

The present invention describes a method (M1) of using a first anti-viral peptide (I) comprising a theta-defensin peptide in an amphipathic alphabatical structure in a lighd environment for reducing the infectivity of a virus. (I) can have virucide and anti-HIV activities, and can be used to reduce virus growth, infectivity burden, shed, and development of anti-HIV activities, and can be used to rival resistance. (I) can be used for inhibiting the growth and so can be used for; (a) protecting or treating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus shed from a VS, reducing percentage of VS in a population regardless of viral infection status, or inducing latency in a VS; (b) reducing the infectivity of a virus; and (c) rendering virus of virus in sheep, cattle, horses, swine, contaminated tissue or fluid sample safe for use, or reducing the number of infectious virus particles in a population of viruses. (M1) is useful for reducing the infectivity of a virus in sheep, cattle, horses, swine, cats, fowl and humans e.g. an enveloped virus infecting humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is administered to a partient who is immunosuppressed to a cubject who is much infected with the virus, where the first anti-viral peptide is administered prior to or subsequent to the virus of a subject who is contaminated represents a rheas monkey thete defensin anti-viral peptide, which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antiblocities. The invention is also useful in gene therapy. The present sequence is rhesus monkey theta defensin, RTD1 peptide. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  bacterial infection; human pathogen; holin; defensin; peptide nucleic acid; PNA; penicillin; tetracycline; ampicillin; kanamycin; antibiotic; antibacterial; antibiotic-resistance gene; cyclic.

This invention describes a novel conjugate for treating prokaryotic confidences a transport mediator for passage through the prokaryotic cell membrane and a compound, directed against a prokaryote and intended for introduction into it. The prokaryote is a bacterium, especially one pathogenic in humans. The transport mediator is preferably confidence or adefension. The introduced compound is a peptide or protein, especially a phage-holin protein, its active fragment or variant or a defension. The introduced compound is a peptide nucleic acid (PNA) that inhibits a gene, especially one implicated in resistance to penicillin, tetracycline, ampicillin or knamayoin. The conjugate has the structure transport mediator-spacer-PNA where the spacer is poly(glysine and/or lysine), preferably containing 2-6 amino acids and the spacer is linked to the transport mediator through a claavable disulfide bridge. The conjugates are administered together with antibiotic, by parenteral, transdermal or subcutaneous routes. The products of the invention have antibacterial activity and are used, especially in combination with antibiotics, for treating prokaryotic, especially in combination with antibiotics, for treating prokaryotic, corresistance gene where the PNA is directed against the antibiotic resistance gene. Where the PNA is directed against containing tered antibiotic sensitive to co-administered antibiotics in 'Old' antibiotics can be used successfully in cases where normally they would be ineffective. This sequence represents a cyclic defension fragment described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô

prostaglandin of the P-series and an antimicrobial peptide. A solution of the invention has hypotensive and ophthalmological activity. The solution is useful for the treatment of increased intracoular pressure, such as caused by glaucoma and for the reduction of ocular hypertension. The prostaglandin and the antimicrobial peptide work synergistically, to provide beneficial reduction in the incidence of irritant and toxic side effects such as hyperaemia, irritation and inflammation of conjunctiva, ocular cell dysplasia, irritial melanocyte hyperplasia, and hyperplasmation, associated with the prior art prostaglandin compositions. The present sequence represents an antimicrobial peptide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               rhesus theta defensin-1; RTD-1; bacteraemia; lipopolysaccharide; LPS; lipteichonic acid; LTB; septic shock; antibacterial; fungicide; virucide; immunomodulator; anticoagulant activity; mincrobial cell-wall biosynthesis; immunomodulation; anticoagulant.

for preparing a composition for treatment and/or prevention of bacteraemia for binding bacterial products such as lipopolysaccharide (LPS) and/or lipteichonic acid (LTA), or for treatment and/or prevention of septic shock RTD-1, isolated from immune cells of rhesus monkeys, has antibacterial, fungicide, virucide, immunomodulator and anticoagulant activity. RTD-1 inhibits microbial cell-wall blosynthesis and also binds activity. RTD-1 inhibits microbial cell-wall blosynthesis and also binds by viruses. RTD-1 combines four advantageous properties: a direct by viruses. RTD-1 combines four advantageous properties: a direct by viruses. RTD-1 combines four advantageous properties: a direct by viruses microbial action, neutralisation of bacterial products (by binding), immunomodulation (reducing release of proinflammatory cytokines but increasing release of regulatory factors) and anticoagulant action, so provides a better and simpler treatment.
                                                                                                                                                                                                            Use of rhesus theta defensin-1 for treating or preventing bacteremia and septic shock, also for binding bacterial products and as immunomodulator and anticoagulant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Monkey, Rhesus theta defensin, RTD-1, antimicrobial peptide, cyclic, antimicrobial, antinflammatory, antibacterial, virucide, fungicide; food, contact lens solution, eye wash solution; inflammatory response; microbicidal inhibition, microbistatic growth inhibition; disinfectant; food preservative; bacterial infection, viral infection; disinfectant; fungal infection; haemolytic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

    18 /note= "The peptide is cyclised by a covalent link
between these two residues"

                                                                                                                                                                                                                                                                                                                          This invention describes the novel use of rhesus theta defensin-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO3527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicidal inhibition of survival of microorganism as well as microbistatic inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensing have high antimicrobial activity and low haemolytic activity. The present sequence represents the rhesus monkey wild-type theta defensin RTD-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Monkey; Rhesus theta defensin; RTD; antimicrobial peptide; antimicrobial; antilnflammatory; antibacterial; virucide; fungicide; food; contact lens solution; eye wash solution; inflammatory response; microbicidal inhibition; microbistatic growth inhibition; disinfectant; food preservative; bacterial infection; viral infection; disinfectant; fungal infection; haemolytic activity.

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO35257. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of an acroorganism in an environment such as food or growth or survival of a microorganism in an environment such as food or cod product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbistatic inhibition of survival of microorganism as well as the reapeutic agents, disinfectants, food preservatives, or medicaments. The appendes are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensing have betterial, viral, fungal or other infection. The theta defensing have high antimicrobial activity and low haemolytic activity. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Monkey; Rhesus theta defensin; RTD; antimicrobial peptide; antimicrobial; antinflammatory; antibacterial; virucide; fungicide; food; contact lens solution; eye wash solution; inflammatory response; microbicidal inhibition; microbicidalstatic growth inhibition; disinfectant; food preservative; bacterial infection; viral infection; disinfectant; fungal infection; haemolytic activity.
                                                           Novel theta defensin analog useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, contact lens solution, or eye wash solution, an inanimate

```
The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as AD035239-AD035257. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism and is useful for reducing prowth or survival of the microorganism and is useful for reducing or inhibiting rowth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for dicroorganism as well as microbistatic inhibition of survival of microorganism as well as the proposition inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from a pactual, viral, fungal or other infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present sequence represents a Rhesus thera defensin analogue peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        defension the claims or appearing as ADOS239-ADOS2557. The thete defension analogue is useful for reducing or inhibiting growth or survival of a microorganism and is useful for reducing or inhibiting growth or survival of the microorganism and is useful for reducing or inhibiting prowth or survival of the microorganism in an environment such as food or food product, as colution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a manmal. The microbicidal inhibition of survival of microorganism as well as microbicidal inhibition of survival of microorganism as well as microbicidismition of growth. Thus the peptides are useful as the peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The thete defensins have high antimicrobial activity and low haemolytic activity. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Monkey, Rhesus theta defensin, RTD-1, antimicrobial peptide, antimicrobial, antinflammatory, antibacterial; virucide, fungicide, food, contact lens solution; eye wash solution; inflammatory response, microbicidal inhibition; microbistatic growth inhibition; disinfectant; food preservative; bacterial infection; viral infection; disinfectant; fungal infection; haemolytic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a theta defensin analogue defined by formulae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

Novel theta defensin analog useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, contact lens solution, or eye wash solution, an inanimate

Claim 1; SEQ ID NO 29; 46pp; English.

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO35257. The theta defeated in the claims or appearing as ADO35239-ADO35257. The theta defeating an anticopy of the state of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting control of the microorganism in an environment such as food or growth or survival of a microorganism in an environment such as food or control, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbistatic inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present constructive in the present in the present and in an analogue peptide.

The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                               Retrocyclin, infection, sexually transmitted disease, gene therapy, HIV, human immunodeficiency virus, bacterial vaginosis, ophthalmic infection, antibiotic modelling, antimicrobial; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated retrocyclin peptide, useful for preventing retroviral infections in cells susceptible to bacterial or viral infections or treating patients having the infections, such as HIV, sexually transmitted diseases, vaginosis.
                                                                                                                                                                                       /note= "Linked to amino acid at position 18 to cyclic structure"

Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
          Retrocyclin, infection, sexually transmitted disease, gene therapy; HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; cyclic.

                                                                                                                                                                                                                                                                                                                        The invention relates to a novel isolated retrocyclin peptide. The invention further provides: a cyclic polypeptide; an isolated nucleic convention further provides: a cyclic polypeptide; an isolated nucleic infection in a cell by administering an effective dose of a circular minidefension or retrocyclin, a method for killing microbial corganisms; a method for administering restrocyclin to the microbial organisms; a method for administering restrocyclin as a microbial organisms; a method for administering restrocyclin as a infection; and a method for administering retrocyclin as a prophlactic agent to prevent a microbial or viral infection; and a method for administering retrocyclin as a prophlactic agent to prevent a microbial or viral infection in a patient at risk of developing such infection. The retrocyclin peptide can be used to treat a viral infection such as HIV-1. The retrocyclin peptide can be used as a vaccine or an beused in immunotherapy. The peptide and polypeptides are useful as therapeutic and prophlactic agents for treating and preventing microbial and viral infections. This sequence represents a retrocyclin
                                                                                                                                                                                                                                                     New isolated retrocyclin peptides and cyclic polypeptides, useful as therapeutic and prophylactic agents for treating and preventing microbial and viral infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        retrocyclin, cyclic; primate; retroviral infection; circular minidefensin; antibacterial; virucide; vaccine; immunotherapy;

The introduction features to a novel isolated retrocycling peptide. The interpretation is each a novel isolated retrocycling an isolated mucleic acid encoding a primate retrocyclin; a method for preventing retroviral infection in a cell by administering an effective dose of a circular minidefensin or retrocyclin to each cell; a method for killing microbial organisms by administering an effective dose of retrocyclin to the organisms by administering an effective dose of retrocyclin to the microbial organism; a method for administering retrocyclin as a therapeutic agent to a patient with an established microbial or viral infection, and a method for administering retrocyclin as a prophylactic agent to prevent a microbial or viral infection in a patient at risk of agent to prevent and microbial or viral infection in peptide has antibacterial and viral such as HIV-1. The retrocyclin peptide can be used to treat a viral infection such as HIV-1. The retrocyclin peptide can be used as a vaccine and can be used in immunotherapy. The peptide and polypeptides are useful as therapeutic and prophylactic agents for treating and preventing microbial and viral infections. This sequence represents a retrocyclin

The present invention describes a method (M1) of using a first anti-viral peptide (I) comprising a theta-defensin peptide in an amphipathic alpha-helical structure in a lipid environment for reducing the infectivity of a virus. (I) can have virucide and anti-HIV activities, and can be used to reduce virus growth, infectivity burden, shed, and development of anti
                                                                                                                                                                                                                 The present invention provides theta defensin peptides and analogues which have antimicrobial activity. They can be used in the treatment of bacterial, viral, fungal, protozoan and helminthic infections, in disinfectants and as food preservatives
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Anti-viral, viral infection, theta-defensin, lipid environment, amphipathic alpha-helical structure, virucide, anti-HIV, immunisation, viral growth inhibitor, viral proliferation inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New method of using a first anti-viral peptide comprising a Theta-defensin peptide in an amphipathic Alpha-helical structure in a lipid environment for reducing the infectivity of a virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Synthetic anti-viral human theta defensin peptide HTD-1 SEQ ID NO:27
                                                                                                                                        Novel theta defensin peptide with antimicrobial activity against
bacteria, yeast, fungi, protozoa and viruses.
                                                                                                                                                                                                                                                                                                                             Query Match

containing subject from be used for inhibiting the growth and proliferation of a virus and so can be used for; (a) protecting or treating subject from a viral infection, preventing recurrent virus infection in a subject harbouring a latent virus, controlling virus spread within a virally-infected subject (VS), reducing virus burden in a VS, reducing virus seed within a virally-infected subject (VS), reducing virus burden in a VS, reducing virus sheed from a VS, reducing percencage of VS; in a population regardless of viral infection status, or inducing latency in a VS; (b) reducing the infectivity of a virus; and (c) rendering virus-contaminated tissue or fluid sample safe for use, or reducing the number of infectious virus particles in a population of viruses. (M1) is useful contaminated the infectivity of a virus in sheep, cattle, horses, swine, cats, fowl and humans e.g. an enveloped virus infecting humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is not infected with the virus, where the first anti-viral peptide is administered prior to or subsequent to the virus contacting the subject. The anti-viral peptide is most preferably administered to a subject who is contaminally, latently or subsequent to the virus contacting the subject. The anti-viral peptide is most preferably administered to a subject who is such an in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Retrocyclin, infection, sexually transmitted disease, gene therapy, HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; human; cyclic.

                                                                                                                                                                                                            임
                                                                                                                                                                                                      ö
                                                                   The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide
                                                                                                                                                                                                                                                                                                                                                                            Retrocyclin; infection; sexually transmitted disease; gene therapy; HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; cyclic.

                                                The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated retrocyclin peptides and cyclic polypeptides, useful as therapeutic and prophylactic agents for treating and preventing microbial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel isolated retrocyclin peptide. The invention further provides: a cyclic polypeptide; an isolated nucleic acid encoding a primate retrocyclin; a method for preventing retroviral infection in a cell by administering an effective dose of a circular minidefensin or retrocyclin to the cell; a method for killing microbial organisms by administering an effective dose of retrocyclin to the microbial organisms; a method for administering a setrocyclin as a therapeutic agent to a patient with an established microbial or viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   retrocyclin, cyclic, primate, retroviral infection; circular minidefensin; antibacterial; virucide; vaccine; immunotherapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

infection, and a method for administering retrocyclin as a prophylactic agent to prevent a microbial or viral infection in a patient at risk of developing such infection. The retrocyclin peptide has antibacterial and virucide activities. The retrocyclin peptide can be used to treat a viral infection such as HIV-1. The retrocyclin peptide can be used as a vaccine and can be used in immunotherapy. The peptide and polypeptides are useful as therapeutic and prophylactic agents for treating and preventing microbial and viral infections. This sequence represents a retrocyclin peptide of the invention.
                                                                                                                                                                                                                                                                                                                    Sequence 18 AA;

Novel theta defensin analog useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, contact lens solution, or eye wash solution, an inanimate object.

Claim 1; SEQ ID NO 23; 46pp; English.

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as AD035239-AD035257. The theta defensin analogue is useful for reducing or inhibiting growth or survival

ö of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicidal inhibition of survival of microorganism as well as marcobisatatic inhibition of growth. Thus the peptides are useful as the repetides are also useful for treating a patient suffering from Dacterial, viral, fungal or other infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present sequence represents a Rhesus theta defensin analogue peptide. Mccray PB,

New method of using a first anti-viral peptide comprising a Theta-defensin peptide in an amphipathic Alpha-helical structure in a lipid environment for reducing the infectivity of a virus.

Disclosure; Page 10; 65pp; English.

The present invention describes a method (MI) of using a first anti-viral peptide (I) comprising a theta-defensin peptide in an amphipathic alphahilaal structure in a lipid environment for reducing the infectivity of a virus. (I) can have virucide and anti-HIV activities, and can be used to reduce virus growth, infectivity burden, shed, and development of anti-viral resistance. (I) can be used for inhibiting the growth and proliferation of a virus and so can be used for; (a) protecting or treating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus

spread within a virally-infected subject (VS), reducing viral burden in a VS, reducing virus shed from a VS, reducing percentage of VS in a US, reducing virus shed from a VS, reducing percentage of VS in a containation regardless of viral infection status, or inducing latency in a VS, (b) reducing the infectivity of a virus; and (c) rendering virus-containated tissue or fluid sample safe for use, or reducing the number of infectious virus particles in a population of viruses. (MI) is useful for reducing the infectivity of a virus in sheep, cattle, horses, swine, cats, fowl and humans e.g. an enveloped virus infecting humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is administered to a patient who is immunosuppressed or to a subject who is not infected with the virus, where the first anti-viral peptide is administered prior to or subsequent to the virus contacting the subject. The anti-viral peptide is most preferably administered to a subject who is contacting represents a chimeric human/rhesus monkey theta defensin anti-viral peptide, which is given in the exemplification of the present

creatinine levels of less than half of those observed in control animals receiving kidneys stored in UW solution (defined in the specification) alone. Lower serum creatinine levels are indicative of healthier kidneys and a more preferable prognosis for the transplant patient. The media of the invention are useful for decreasing the incidence and/or severity of delayed graft function in patients receiving transplanted kidneys stored and/or treated in the media. The media may also be used in procedures such as cardioplegia. It is contemplated that transplant of healthier organs leads to a decrease in chronic rejection. This sequence represents an antimicrobial defensin peptide studied in the development of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Retrocyclin; infection; sexually transmitted disease; gene therapy; HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; cyclic.

The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin mediated killing is useful for modalling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Retrocyclin, infection, sexually transmitted disease, gene therapy, HIV, human immunodeficiency virus, bacterial vaginosis, ophthalmic infection, antibiotic modelling, antimicrobial; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "Linked to amino acid at position 18 to form a cyclic structure"

```

The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The

```
The invention relates to a novel isolated retrocyclin peptide. The invention further provides: a cyclic polypeptide; an isolated nucleic acid ancoding a primate retrocyclin; a method for preventing retroviral infection in a cell by administering an effective dose of a circular mindefensin or retrocyclin to the cell; a method for xilling microbial organisms by administering an effective dose of retrocyclin to the microbial organisms; a method for administering restrocyclin as a therapeutic agent to a patient with an established microbial or viral infection; and method for administering restrocyclin as a prophytactic agent to prevent a microbial or viral infection in a patient at risk of developing such infection. The retrocyclin peptide has antibacterial and infection such as HIV-1. The retrocyclin peptide can be used as a vaccine and can be used in immunotherapy. The peptide and polypeptides are useful and viral infections. This sequence represents a retrocyclin peptide of the invention.
                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated retrocyclin peptides and cyclic polypeptides, useful as therapeutic and prophylactic agents for treating and preventing microbial and viral infections.
retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                retrocyclin; cyclic; primate; retroviral infection; circular minidefensin; antibacterial; virucide; vaccine; immunotherapy; microbial; viral; human.

The present invention describes a method (M1) of using a first anti-viral peptide (I) comprising a thera-defensin peptide in an amphipathic alphace peptide (I) comprising a thera-defensin peptide in an amphipathic alphact peptide is structure in a lipid environment for reducing the infectivity of a virus. (I) can have virucide and anti-HIV activities, and can be used for including the growth and conce virus and so can be used for inhibiting the growth and concernation of a virus and so can be used for; (a) protecting or treating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus in subject harbouring a latent virus, controlling virus shed from a VS, reducing virus shed from a VS, reducing virus latency in a VS, reducing virus shed from a VS, reducing virus infections in infections virus and (c) rendering latency in a VS, (b) reducing the infectivity of a virus; and (c) rendering virus.

CC of infectious virus particles in a population of viruses. (M1) is useful for reducing the infectivity of a virus in sheep, cattle, horses, swine, cortain manunodeficiency virus (HIV). Preferably, the anti-viral peptide is containistered prior to a subsequent to the virus contacting the subject. The anti-viral peptide is most preferably administered to a patient who is immunosuppressed or to a subject who is contacting the virus. The present contacting peptide is containistered to a patient whose the first anti-viral peptide is contacting in the exemplification of the present invention in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                             New method of using a first anti-viral peptide comprising a Theta-defensin peptide in an amphipathic Alpha-helical structure in a lipid environment for reducing the infectivity of a virus.
amphipathic alpha-helical structure, virucide, anti-HIV, immunisation; viral growth inhibitor, viral proliferation inhibitor.
                                                                                                                                                                                                                                                                                             Tack
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .,

                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides theta defensin peptides and analogues which have antimicrobial activity. They can be used in the treatment of bacterial, viral, fungal, protozoan and helminthic infections, in disinfectants and as food preservatives

Rhesus theta defensin analogue peptide aRTD-3-NH
The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as AD03523-30-AD03527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism and is useful for reducing or inhibiting rowth or survival of the microorganism and is useful for reducing or inhibiting trowth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbistatic inhibition of survival of microorganism as well as the appendes are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful suffering a patient suffering from the peptides are also useful suffering a patient suffering from the peptides are also useful suffering a patient suffering from the peptides are also useful suffering a patient suffering from the peptides are also useful suffering a patient suffering from the peptides are also useful suffering a patient suffering from the peptides are also useful suffering from the peptides ar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO3527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of the microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash colution), an inanimate object compatising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicidal inhibition of growth. Thus the peptides are useful as incobistatic inhibition of growth. Thus the peptides are useful as the rapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensins have high antimiorobial activity and low haemolytic activity. The present sequence represents a Rhesus theta defensin analogue peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò

defensin analogue peptide aRTD-3-OH.

(first entry)

```
The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as AD035239-AD035257. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicidal inhibition of survival of microorganisms as well as microbistatic inhibition of growth. Thus the peptides are useful as the respectic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present sequence represents a Rhesus theta defensin analogue peptide.
                                                                                                                Monkey; Rhesus theta defensin; RTD; antimicrobial peptide; antimicrobial; antiinflammatory; antibacterial; virucide; fungicide; food; contact lens solution; eye wash solution; inflammatory response; microbicidal inhibition, microbistatic growth inhibition; disinfectant; food preservative; bacterial inflection; viral inflection; disinfectant; fungal inflection;

Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                                                              Retrocyclin; infection; sexually transmitted disease; gene therapy; HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; cyclic.

```
The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                    Retrocyclin, infection, sexually transmitted disease, gene therapy, HIV, human immunodeficiency virus; bacterial vaginosis; ophthalmic infection, antibiotic modelling; antimicrobial; cyclic.
                                                                                                                                                                             /note= "Linked to amino acid at position 18 to form a cyclic structure"

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO3527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting cowth or survival of a microorganism in an environment such as food or sourtion, an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicidal inhibition of survival of microorganism as well as microbistatic inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for the infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present sequence represents a Rhesus theta defensin analogue peptide.
Monkey, Rhesus theta defensin, RTD; antimicrobial peptide, antimicrobial, antinflammatory; antibacterial; virucide, fungicide, food; contact lens solution, eye wash solution, inflammatory response; microbicidal inhibition, microbistatic growth inhibition; disinfectant; food preservative, bacterial infection; viral infection; disinfectant; fungal infection; haemolytic activity; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel theta defensin analog useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, contact lens solution, or eye wash solution, an inanimate object.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
